# Press: Turkish Daily News

Istanbul, June 23, 2005

A Top Level Domain (TLD) system has been launched in Turkey as the result of an alliance between the Turkish Informatics Association ([TBD](#)) and Unified Identity Technology ([UNIDT](#)), officials announced on Wednesday.

Top Level Domain is the portion of a traditional domain name that comes after the dot. The generic Top Level Domains (gTLDs) are: .com, .net and .org, the other type of TLDs include the country code Top Level Domains (ccTLD), which are assigned to all countries and their dependencies such as .tr for Turkey.

Top Level Domains (TLD) will be put up for sale by Turkish Internet service providers, Turkish Informatics Association Chairman Turhan Mentès said.

Mentes said the deal with UNIDT might offer new possibilities for Turkish corporations, as they will be free to use their own names as domain names on the Internet.

Access to TLDs is supported by a federation called [Public-Root](#), which emerged due to shortcomings in the existing Internet infrastructure and monopolistic tendencies, Mentès said.

TLDs also single out search results, instead of hundreds or thousands of results one gets when using the search engines on ordinary servers.

Mentes said Public-Root supports the existing Internet domains and one of the [13 root servers](#) worldwide is located in [Ankara](#).
